Company Profile

Lateral AS was founded in 2000 and has, since then, served the offshore and subsea industry delivering expertise, solutions, products and services to a long list of operators and oil and gas suppliers.

Lateral designs and manufactures bespoke tools and solutions to meet customer requirements.

Lateral is based at Bedriftsveien 20, 4313 Sandnes, Norway, with offices, workshop and stores located as a single unit.

Our closely-knit team of 7 engineers and technicians have a wide range of experience. This breadth enables us to find solutions in other domains and bring them into the oil and gas industry.

Lateral's primary market is the Norwegian Continental Shelf, but our tools and services are supplied globally by our staff and through our agents.

Lateral performs subsea mooring integrity inspections for a long list of clients, performing high accuracy measurements of mooring chain and CVI and dimensional verification of mooring wire and ropes.

Lateral has a range of subsea tools for cleaning, inspection and measurement of subsea infrastructures.

Lateral uses a number of local, qualified sub-suppliers to manufacture various components for our tooling, while keeping assembly, quality control, final testing and approval in house.

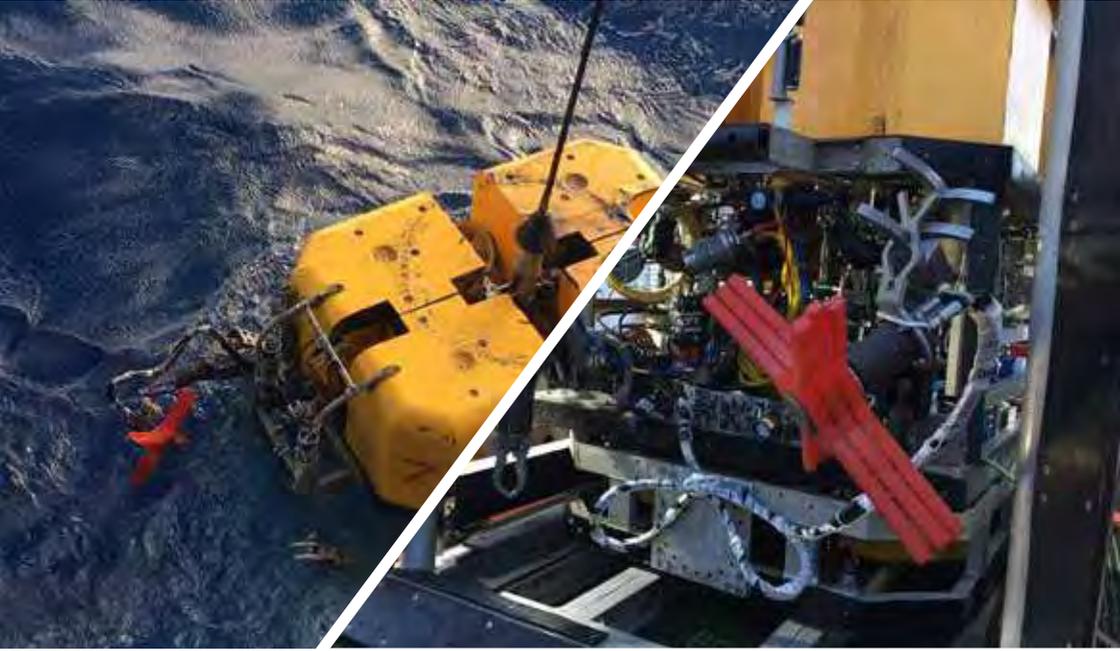

Our cleaning solution is the patented, industry standard FlexiClean. FlexiClean removes marine fouling faster than any other tool without damaging the underlying surface.

Our measurement tools are adapted to suit the geometries in question and deliver sub-millimetric accuracy in real time.

Lateral also delivers sub-sea curing epoxy solutions used for repair, patching, coating, grouting and water blocking.

Lateral's philosophy is to understand the challenge and find the right solution through innovation and cross-domain adaptation

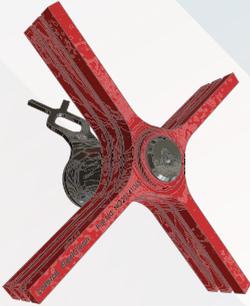

Introducing the FlexiClean Family

Handcrafted

FlexiClean Standard

The Standard FlexiClean is designed for a WorkClass ROV and is the fastest and most versatile cleaning tool available.

FlexiClean Mini

For smaller ROV's, we developed the FlexiClean MINI. The MINI has the same diameter as the Standard, but with only one layer of fingers

FlexiClean Axial

This odd looking tool does an amazing job reaching hard to get areas like hawse-tubes, caissons and water intakes

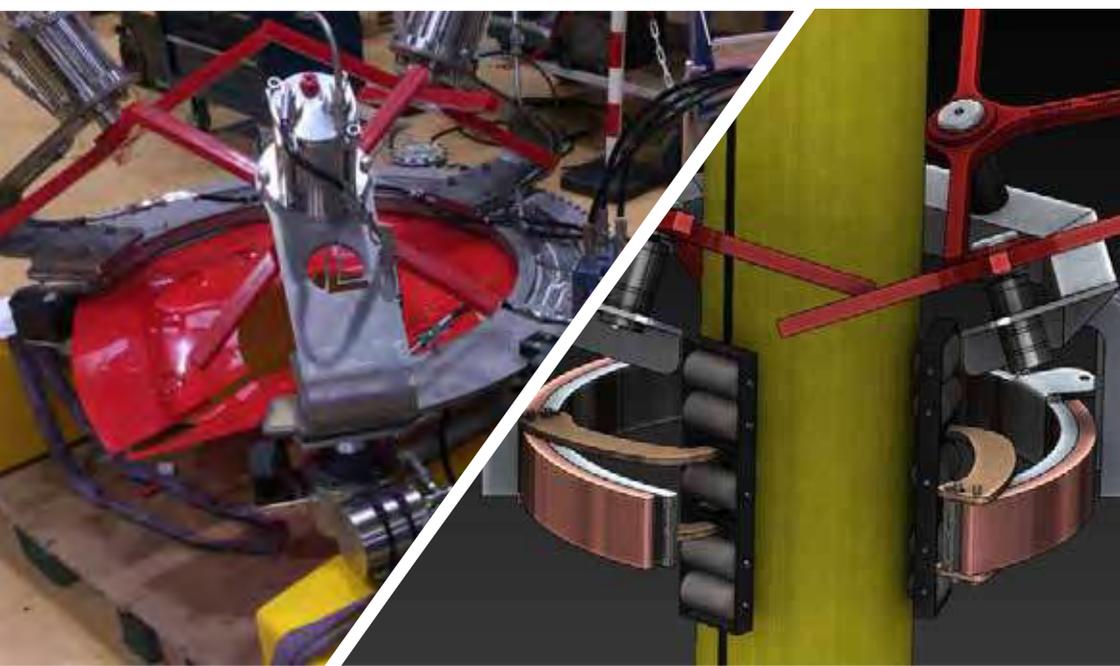

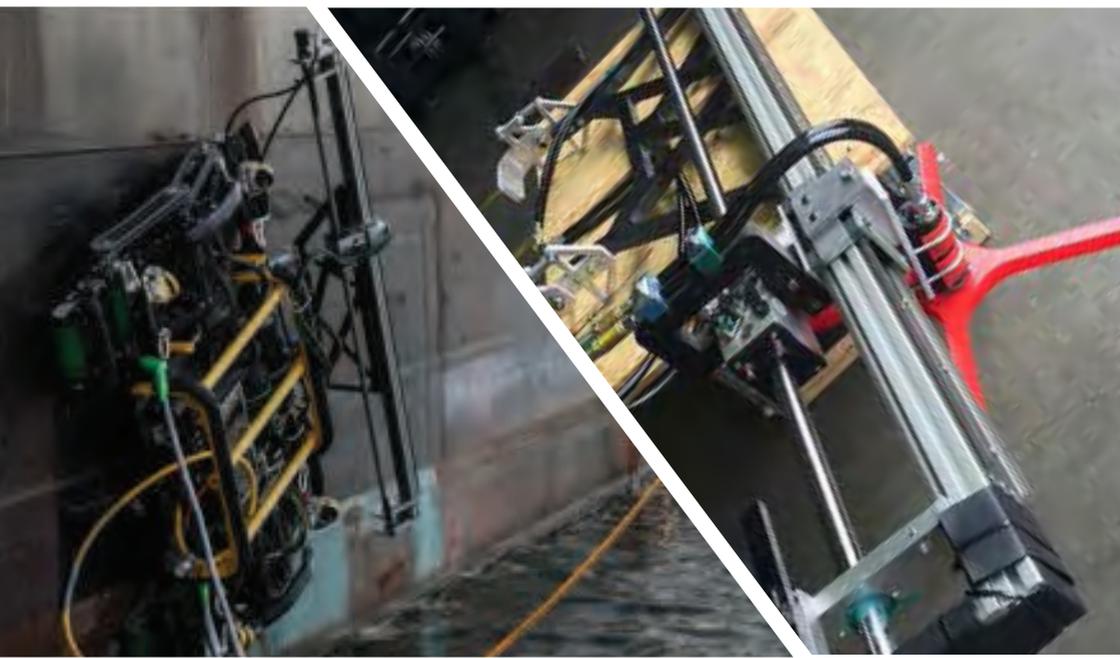

FlexiClean Micro

The drive is electric or hydraulic, making this a versatile, small cleaning tool for those hard to reach places. The reduced size, weight and power-requirements place the MICRO well inside the realm of what a smaller observation class ROV can handle.
